

# Why We Ventilate

Max Sherman  
*Lawrence Berkeley National Lab  
ASHRAE Distinguished Lecturer*

## ASHRAE BIO

- ❖ Distinguished Lecturer
- ❖ Exceptional Service Award
- ❖ Board of Directors; TechC
- ❖ Chair of committees:
  - ❖ 62.2; Standards Committee
  - ❖ TC 4.3; TC 2.5
- ❖ Holladay Distinguished Fellow

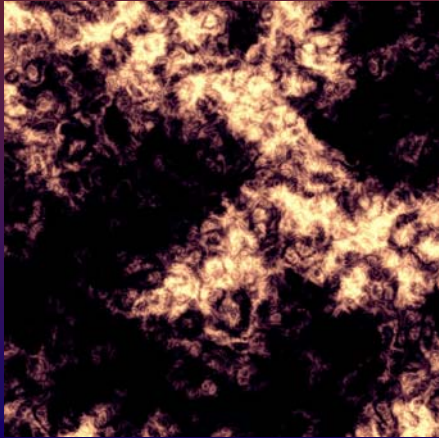

## OVERVIEW

- ❖ What is Ventilation? What is IAQ?
- ❖ Why *do* we ventilate? Why don't we?
- ❖ When will we learn?
- ❖ How can we be smart about setting standards?
- ❖ What is the role of ventilation in buildings

## Who Are You?

- ❖ Engineers (ASHRAE Members & not);
- ❖ architects,
- ❖ contractors,
- ❖ reps,
- ❖ builders,
- ❖ vendors,
- ❖ code officials

**WHAT IS VENTILATION**

- ❖ Medicine: To Exchange Air In the Lungs
- ❖ Latin: *Ventilare*, “to expose to the wind”
- ❖ Today: To Bring In Outdoor Air And Replace Indoor Air Of The Occupied Space
- ❖ Long History

**HISTORY OF STANDARDS**

- ❖ Contaminants require ventilation
  - ❖ From cave-man to euro-man
- ❖ Rates and design based on expert judgments
  - ❖ From cave-man to euro-man
- ❖ Science is latecomer
  - ❖ Need to find what we are ventilating for

## Early Codes and Standards

- ❖ 1631 King Charles & Windows
- ❖ 4 cfm/p 1836 Tredgold “Parliament Stinks”
  - ❖ Steady rise as research continues
- ❖ 30 “ 1895 ASVE Contagion-based
- ❖ 30 “ 1925 22 US State Codes
- ❖ 1927 UBC Requires 1/8 Windows

*Silly English did not know that 2 cfm = 1 l/s*

## ASHRAE Standards History

- ❖ ASHRAE 62-73 Was 5 cfm/person
  - ❖ 15-20 cfm/p recommendation
- ❖ ASHRAE 62-81 Was 5 cfm/person
  - ❖ But 15 cfm, *if smoking allowed*
- ❖ ASHRAE 62-89
  - ❖ 15 cfm/p assumed moderate smoking
  - ❖ 0.35 ACH for houses

## Residential 62

- ❖ 62-89 residential section was very vague
  - ❖ Failed attempt to improve it in famous “62-89R”
- ❖ Separate 62.2 committee formed in 1997
  - ❖ Much gnashing ensued
- ❖ 62.2-2003 was first version
  - ❖ Many changes since
- ❖ Latest version is 62.2-2013

## Why Do We Ventilate Today?

- | Sustainable                        | Not Sustainable                     |
|------------------------------------|-------------------------------------|
| ❖ Improves Comfort                 | ❖ Reduces Comfort                   |
| ❖ Reduces Exposure to Contaminants | ❖ Increase Exposure to Contaminants |
| ❖ Saves Energy                     | ❖ Costs Energy                      |
| ❖ Control Moisture                 | ❖ Causes Moisture Problems          |
| ❖ Improved Durability              | ❖ Reduces Durability                |

## WE VENTILATE FOR COMFORT

- ❖ Thermal Comfort (IEQ not IAQ)
  - ❖ Prevents overheating by venting excess heat
  - ❖ Air movement makes us feel cooler
  - ❖ Ventilative cooling is another topic
- ❖ Odor Control
  - ❖ Not all odors are bad: personal differences
  - ❖ Occupants are best “sensors” –can take actions
  - ❖ *Most* odors not controlled by constant ventilation

## One Odor Matters: US!

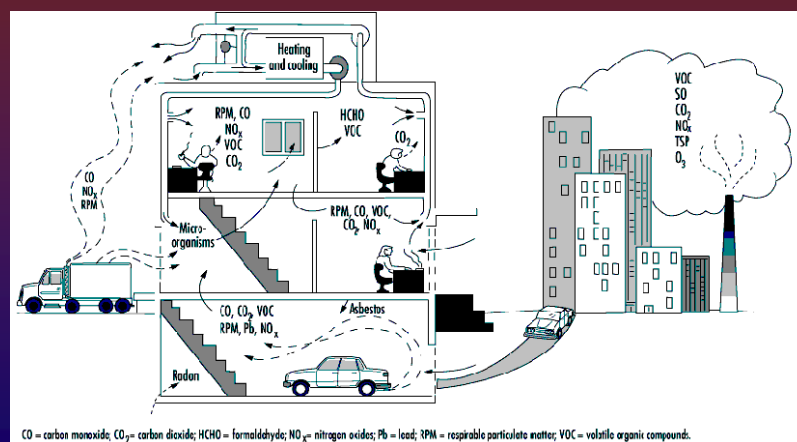

- ❖ People Emit “Human Bioeffluents”
  - ❖ CO<sub>2</sub> is only surrogate
- ❖ Daily Hygiene of Western World
  - ❖ 5 cfm adapted (occupants)
  - ❖ 15 cfm unadapted (visitors)
- ❖ Dominates In High-Density Spaces
- ❖ Sets Floor Otherwise

## VENTILATE FOR HEALTH

- ❖ Occupants not usually good sensors
  - ❖ So, we must design healthy buildings
- ❖ Key Questions:
  - ❖ What are the important contaminants?
  - ❖ How do we measure harm from them?
  - ❖ How do we mitigate that harm?

## CONTAMINANT SOURCES

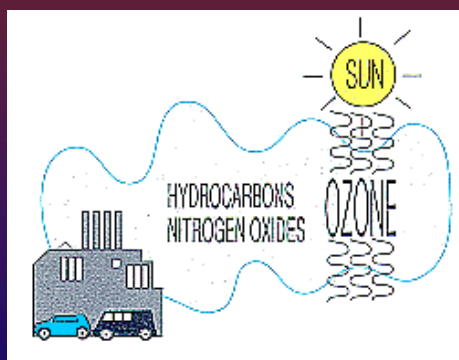

## BUT NOT FOR....

- ❖ We do NOT ventilate for contagion control
  - ❖ Maybe in hospitals but not in homes or offices
- ❖ We do NOT ventilate to supply “fresh air”
  - ❖ <2% of 62.2 rates needed to supply oxygen for people
- ❖ We do NOT ventilate to *supply* anything

*Ventilation is about chronic pollutant removal*

*Local Exhaust is about acute source removal*

## OZONE

- ❖ Usually Lower Indoors
- ❖ Highly Reactive
  - ❖ Reacts w/ almost anything
- ❖ Can Be Mitigated by
  - ❖ Envelope Performance
  - ❖ Closed Windows
  - ❖ Pressure Management
  - ❖ Activated Carbon

## COMBUSTION

- ❖ Lots of Pollutants
  - ❖  $\text{NO}_x$ ,  $\text{SO}_x$ ,  $\text{CO}_x$
  - ❖  $\text{H}_2\text{O}$
  - ❖ Ash & Soot
  - ❖ Other Stuff
- ❖ Outdoors
- ❖ Indoors worse if not vented

## NAAQS: CRITERIA POLLUTANTS

- ❖ Lead: A Lesser Airborne Contaminant Of Concern
  - ❖ Still some local issues
- ❖ SO<sub>2</sub>: From High-Sulfur Coal In Power Plants
  - ❖ Acid Rain is a local phenomena
- ❖ CO, NO<sub>2</sub>: Mostly From Combustion
- ❖ Ozone: Photochemically Produced From (Auto) Combustion By-Products
- ❖ Particulates: PM<sub>2.5</sub> (*mass below 2.5μ*)

## BIOLOGICAL

- ❖ Dust Mite, Pets
- ❖ Mold, Fungi
- ❖ Allergies
- ❖ Asthma

Mostly moisture control

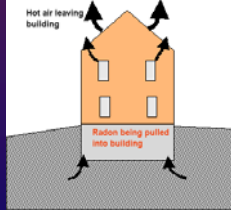

## Toxic Air Contaminants

- ❖ Activities
  - ❖ Cleaning
  - ❖ Painting
  - ❖ Pesticides
  - ❖ Hobbies
  - ❖ Office
- ❖ Residues Linger
- ❖ Entrainment

## BUILDING EMISSIONS

- ❖ Volatile Organic Compound (VOC)
  - ❖ Formaldehyde
- ❖ Radon
  - ❖ Soil Gas
- ❖ Particles
- ❖ Others

## WHAT SOURCES MATTER?

- ❖ Hazards Analysis
  - ❖ Identify likely contaminants of concern
  - ❖ Compare measured concentrations to standards
- ❖ Harm (Risk) Analysis
  - ❖ What is the harm done from these hazards
  - ❖ What should be the focus of mitigation efforts

## Conduct Hazard Analysis

- ❖ Study includes 77 published studies of measured concentrations indoors; focus on US homes
  - ❖ 67 relevant to long term concentrations
  - ❖ 10 relevant to short term concentrations
- ❖ 267 chemicals were included: criteria pollutants, VOCs, SVOCs, and metals
- ❖ 97 chemicals had relevant health standard or metrics for comparison

## Comparing Concentrations to Health Standards

- ❖ Criteria Pollutants
  - ❖ US EPA- NAAQS (1hr, 8hr, 24hr, annual)
  - ❖ WHO (1hr, 8hr, 24hr, annual)
- ❖ HAPs/TACs
  - ❖ Cancer Health Standards
    - ❖ California EPA - Unit Risk Estimates
    - ❖ US EPA - Unit Risk Estimates
  - ❖ Non-Cancer Health Standards
    - ❖ California EPA-Reference Exposure Levels (1hr, 8hr, annual)
    - ❖ US EPA – Reference Concentrations (annual)

## Note: ACUTE vs. CHRONIC

- ❖ Acute exposures involve strongly intermittent sources and short-term effects
- ❖ Chronic exposures caused by low level, but continual sources and have long-term effects
- ❖ Ventilation standards control
  - ❖ Acute exposures by source control or local exhaust
  - ❖ Chronic exposures by general ventilation

## Identifying Chronic Health Hazards

- ❖ Non-Cancer
  - ❖ Direct comparison to published values
- ❖ Cancer
  - ❖ Cancer "REL" set to a cancer risk that correspond to a lifetime incremental risk of 1 in 10<sup>5</sup> assuming 70 years of continuous exposure

## Top 10 Chronic IAQ Hazards

### Priority Hazards

- ❖ acetaldehyde,
- ❖ acrolein,
- ❖ benzene,
- ❖ 1,3-butadiene,
- ❖ 1,4-dichlorobenzene,
- ❖ formaldehyde,
- ❖ naphthalene,
- ❖ NO<sub>2</sub>,
- ❖ PM<sub>2.5</sub>.

### Not listed

- ❖ Carbon Tetrachloride
- ❖ Ozone
- ❖ Radon
- ❖ Tobacco Smoke

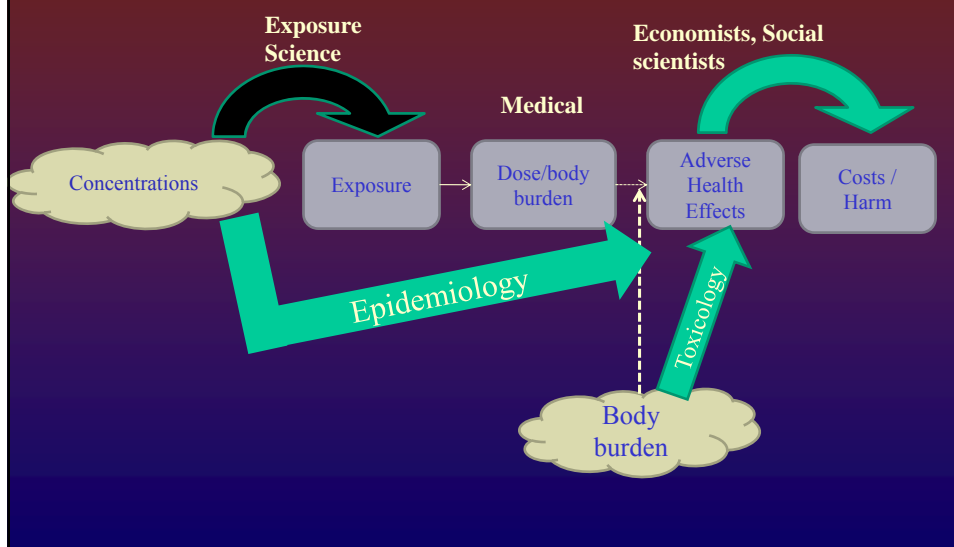

## Contaminant Standards Questionable

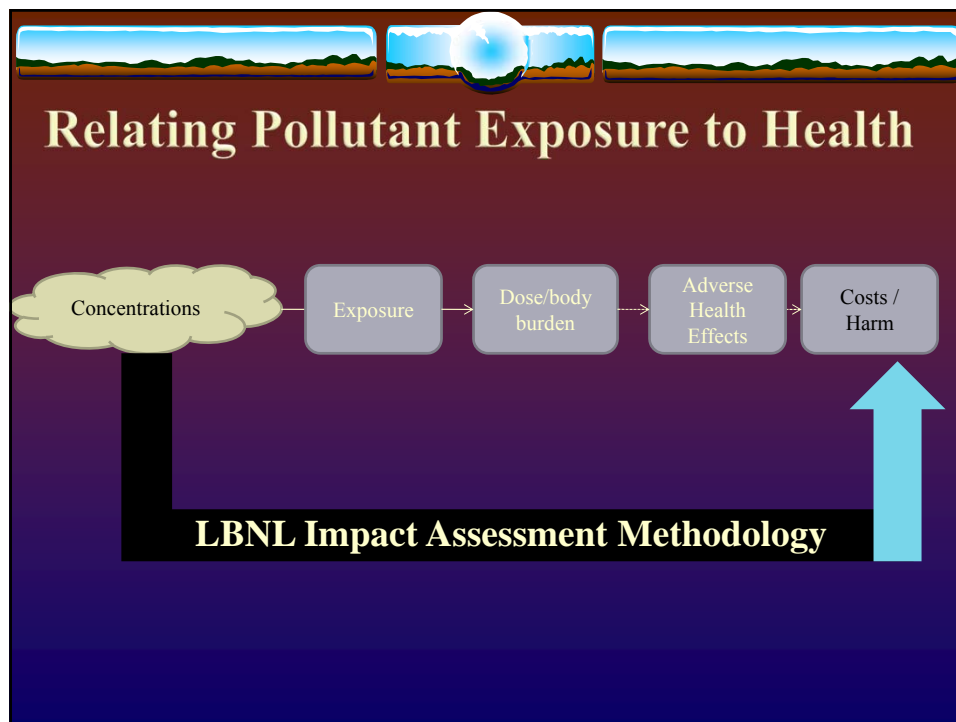

- ❖ Based on expert opinions backed by data
- ❖ But are political decisions
  - ❖ Costs & benefits; practicalities; good as can be
- ❖ Do not use same health impact criteria
  - ❖ So, can't be compared or "traded"
- ❖ Need level playing field
  - ❖ to get total cost/harm from contaminants

## “Obvious” Approach

- ❖ Find out what harm (cost) a given exposure has.
  - ❖ Using a common metric
- ❖ Would allow trade-offs, and comparisons
  - ❖ Design optimization
- ❖ But not as easy to do as it is to say
  - ❖ interdisciplinary

## Many Disciplines Involved

## Costs of Adverse Health Effects

- ❖ Disability Adjusted Life Years (DALYs)

$$DALY = YLL + YLD$$

- ❖ YLL = Years lost to premature death
- ❖ YLD = Equivalent years lost to disability
- ❖ DALY valued at roughly \$50,000 - \$160,000
- ❖ Non-Fatal Stroke: ~9.5–13 DALYs
- ❖ PM2.5 Mortality: ~1.2-10 DALYs

32

## Indoor Concentrations → DALYs

❖ Annual DALYs lost per person=

❖ Criteria Pollutants

$$\Delta \text{concentration} * \frac{\partial \text{Disease\_Incidence}}{\partial \text{concentration}} * \frac{\partial \text{DALYs}}{\partial \text{Disease}}$$

❖ Single component gas phase pollutants

(Huijbregts)

$$\text{inhaled\_mass} * \frac{\partial \text{DALYs}}{\partial \text{inhaled\_mass}}$$

## Criteria Pollutant Approach

❖ Concentration-Response functions

- ❖ Relate increased exposure to disease incidence
- ❖ Derived from epidemiology studies

$$\frac{\partial \text{Disease incidence}}{\partial \text{concentration}} * \Delta \text{concentration} = -[y_0 (\exp(-\beta \Delta C_{\text{exposure}}) - 1)]$$

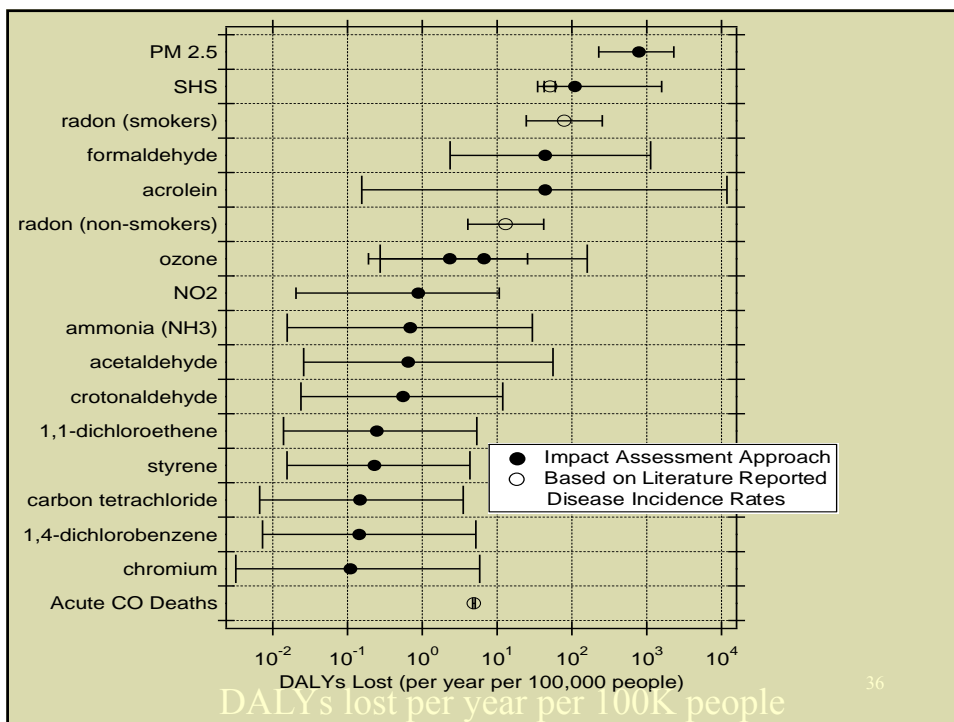

❖ DALYs per incidence of disease (Various)

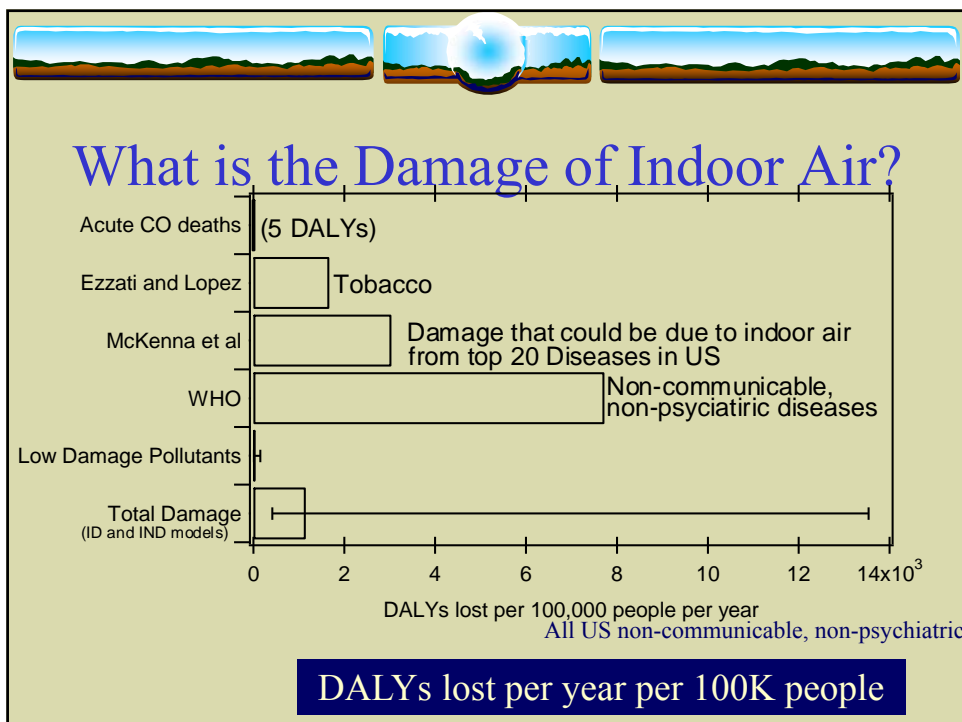

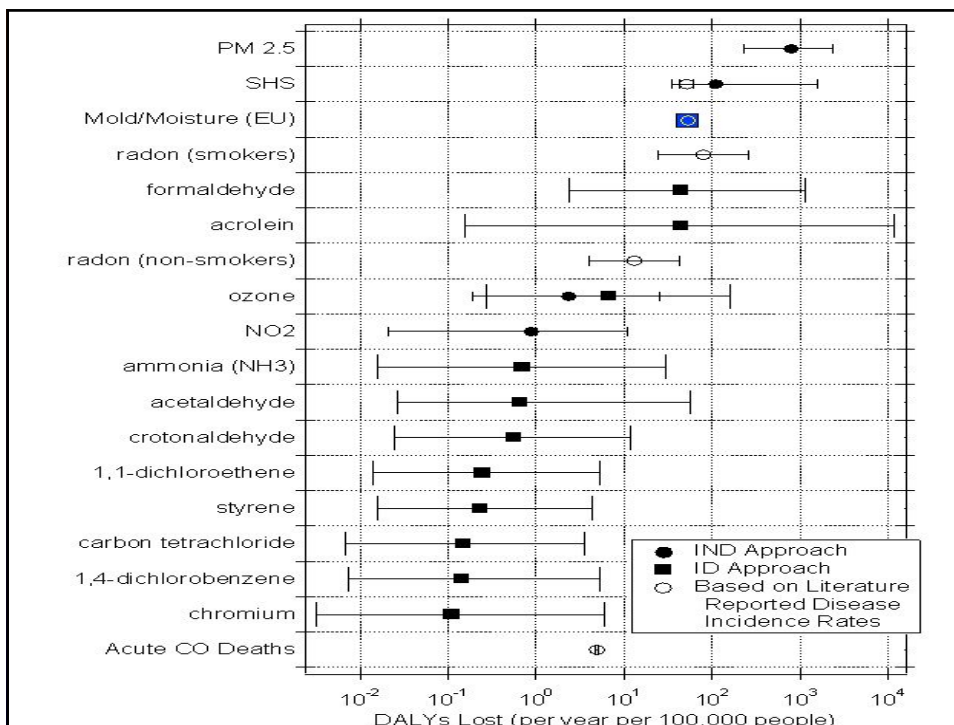

❖ Exposure concentrations (Logue et al. 2011)

## Checking Methodology: SHS

- ❖ Applied to concentrations of secondhand smoke components
- ❖ Determined damage associated with reported health impact of SHS by EPA
- ❖ Results help assess uncertainty of other indoor pollutant impacts

Method	DALYs lost (per year per 100K pop.)
Impact Assessment	~100
Reported Incidence	~5

## What Pollutants are the main risk drivers? (excludes SHS and radon)

## EQUIVALENCE

- ❖ Trade-offs allow smart design
- ❖ Equivalence allows health trade-offs
  - ❖ Implicit or Explicit
- ❖ How do we get there ?
  - ❖ Philosophy for enabling innovation

## Study Results

1. PM<sub>2.5</sub> is most significant indoor health hazard
    - ❖ Can have significant outdoor source
  2. Product of combustion are 2<sup>nd</sup> most
    - ❖ Acrolein is biggest chronic contributor
    - ❖ Least studied of important compounds
  3. Formaldehyde is 3<sup>rd</sup> most
    - ❖ Even though it meets WHO standards
- ...not counting smoking or Radon or acute*

## Control Approaches (> Std 62)

1. Particle filtration (PM<sub>2.5</sub>)
  - ❖ Ventilation may not handle particles well
2. Combustion control (Acrolein et al)
  - ❖ Do not let products of combustion into space
3. Low emitting materials (HCHO mostly)
4. Then dilution ventilation (>human odor needs)
  - ❖ *We don't know what we don't know*

## A Word on Equivalence

- ❖ Uses science to
- ❖ Health/IAQ Equivalence: equivalent harm
  - ❖ Ultimate objective of IAQ standards
  - ❖ DALY is good metric, but don't have enough info
- ❖ Ventilation Equivalence: equivalent exposure
  - ❖ Assumes generic contaminant of unknown harm
  - ❖ Embodied in ASHRAE 62.2

## FOR MORE INFORMATION

- ❖ Residential Building Systems Group
  - ❖ <http://homes.lbl.gov>
- ❖ Air Infiltration and Ventilation Center ([AIVC](http://www.aivc.org))
  - ❖ <http://www.aivc.org>
- ❖ ASHRAE
  - ❖ <http://www.ashrae.org>

## CURRENT ASHRAE STANDARDS

- ❖ 62.1-2010: Non Residential
  - ❖ Users Manual and companion guideline
- ❖ 62.2-2010: Residential
  - ❖ Users Manual and companion guideline
- ❖ Guideline 10: Indoor Environmental Quality

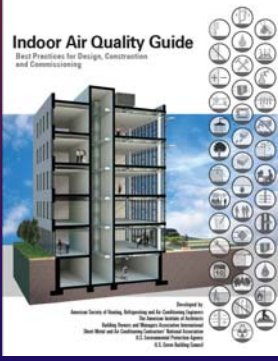

## *The Latest Tool for Good IAQ* **ASHRAE's Indoor Air Quality Guide**

Practical guidance on achieving good IAQ in commercial buildings

Joint effort of ASHRAE, AIA, BOMA, US EPA, SMACNA, USGBC

200 page book, 500 page CD

Available now

The image shows the cover of the 'Indoor Air Quality Guide' book and CD. The cover features a 3D cutaway of a modern building with a glass facade, set against a blue sky. To the right of the building is a vertical column of 20 circular icons representing various indoor air quality issues and solutions. The title 'Indoor Air Quality Guide' is prominently displayed at the top, with the subtitle 'Best Practices for Design, Construction and Commissioning' below it. At the bottom of the cover, it lists the organizations involved: American Society of Heating, Refrigerating and Air Conditioning Engineers (ASHRAE), International Association of Architects and Engineers (IAA), Building Owners and Managers Association (BOMA), U.S. Environmental Protection Agency (EPA), and U.S. Green Building Council (USGBC).
